DAY-3 Salesforce Training

PART-1

In the part 1 we have dicuss about the basic interview questions that were related to the formala validation, flow and triggers

1.What is a Validation Rule?

A Validation Rule is a declarative feature in Salesforce that checks whether the data entered into a record meets specific conditions before it is saved. If the condition evaluates to TRUE,If its not then it will display an error.

2. What is a Flow?

A Flow is a declarative automation tool in Salesforce used to automate business processes without writing Apex code. It can create, update, delete records, send emails, display screens, and perform calculations automatically.

3. What is an Apex Trigger?

A Flow is a declarative automation tool in Salesforce used to automate business processes without writing Apex code. It can create, update, delete records, send emails, display screens, and perform calculations automatically.

4. When would you choose a Flow instead of a Trigger?

I would choose a Flow when the automation can be implemented without writing code, such as updating fields, creating related records, sending emails, or automating approval processes. Flows are easier to maintain and are recommended whenever possible.

5. Can a Validation Rule update another field? Why or why not?

No. Validation Rules only validate data before saving a record. They cannot update fields because their purpose is to prevent invalid data from being saved.

6. Which executes first: Validation Rule, Flow, or Trigger?

7. What is a Record-Triggered Flow?

A Record-Triggered Flow is a Flow that automatically runs whenever a record is created, updated, or deleted. It is commonly used to automate business processes without writing Apex code.

PART-2

Based on the Business Scenario we have created the new custom object called

Student, cgpa, application, offer letter and inside I have created the new fields for each session of it

Like student name , cgpa , applied for, application date for each object I have created the 3 fields of it

The main agenda is the application date has to be filled automatically with the based on the deadline of the application and the application date has been filled to it .

Then the automatically the mail to send to the student submits an application

And mainly prevents the duplicate values from it Automatically create an Offer Letter when the application status becomes Selected. Automatically populate the Application Date.

PART-3

For each requirement below, decide which solution is most appropriate.

Requirement

Reject duplicate applications –

In this we use the Validation rule .

Validation Rules prevent duplicate data before saving.

Auto-fill Application Date -

For this we use flow controls

Before-Save Flow updates the field efficiently.

Send Email –

For this we use the flow controls.

Flow provides a built-in Send Email action.

Reject low CGPA –

In this we use the Validation formula

Validation Rule checks eligibility before saving.

Create Offer Letter record –

In this we use the flows

After-Save Flow creates the related record automatically.

Based on the requirement then based on that we can use either validation rule, flow, Triggers.

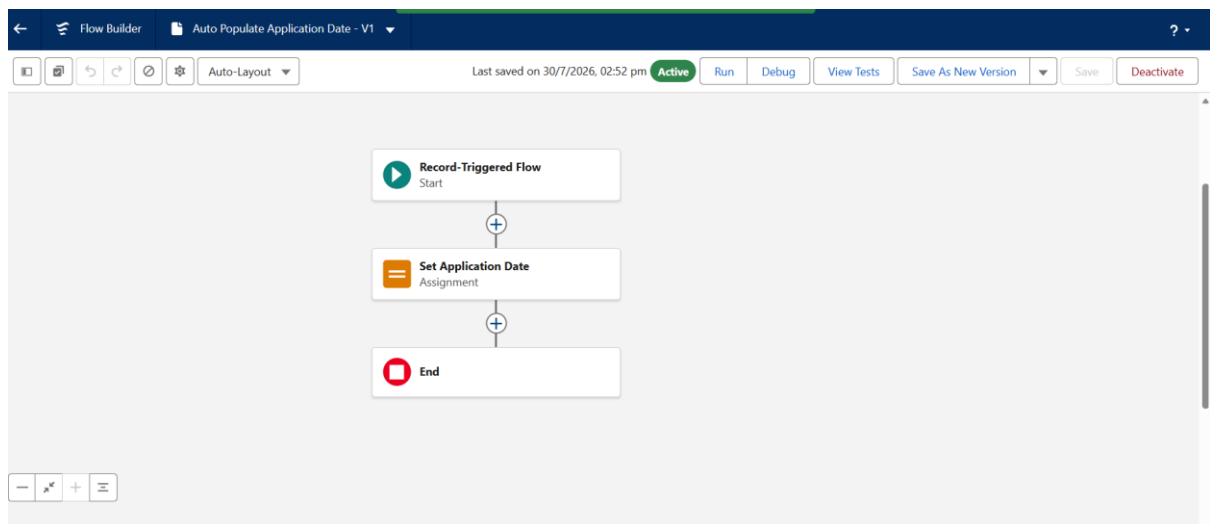

PART-4

Auto Application Date:

A Before-Save Record-Triggered Flow was created on the Application object. Whenever a new Application record is created, the Application Date is automatically set to the current date.

We have created the new flow

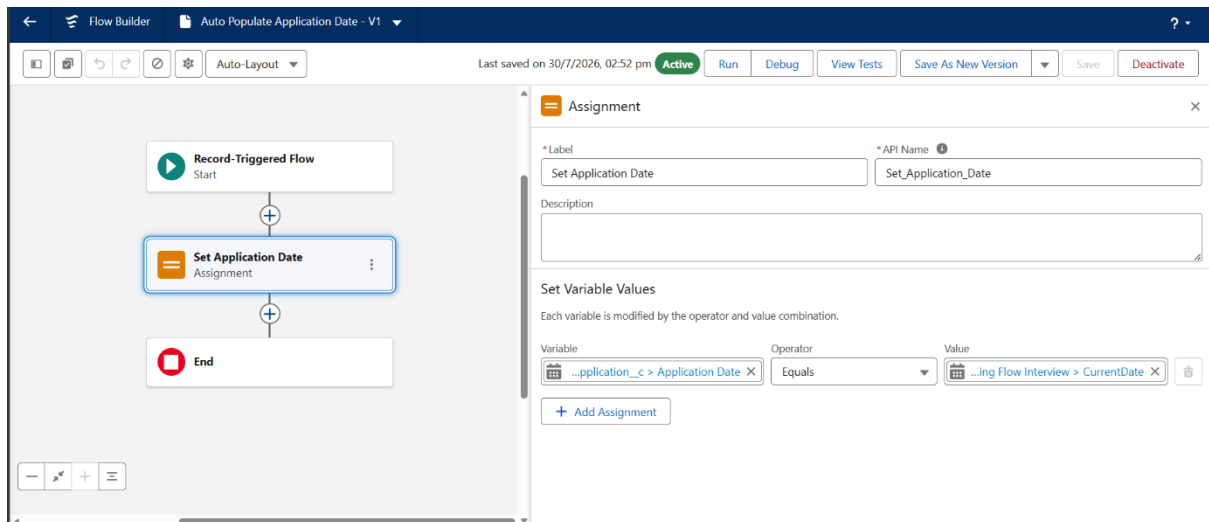

For that need to go to the setup and search for the flows in that new flow

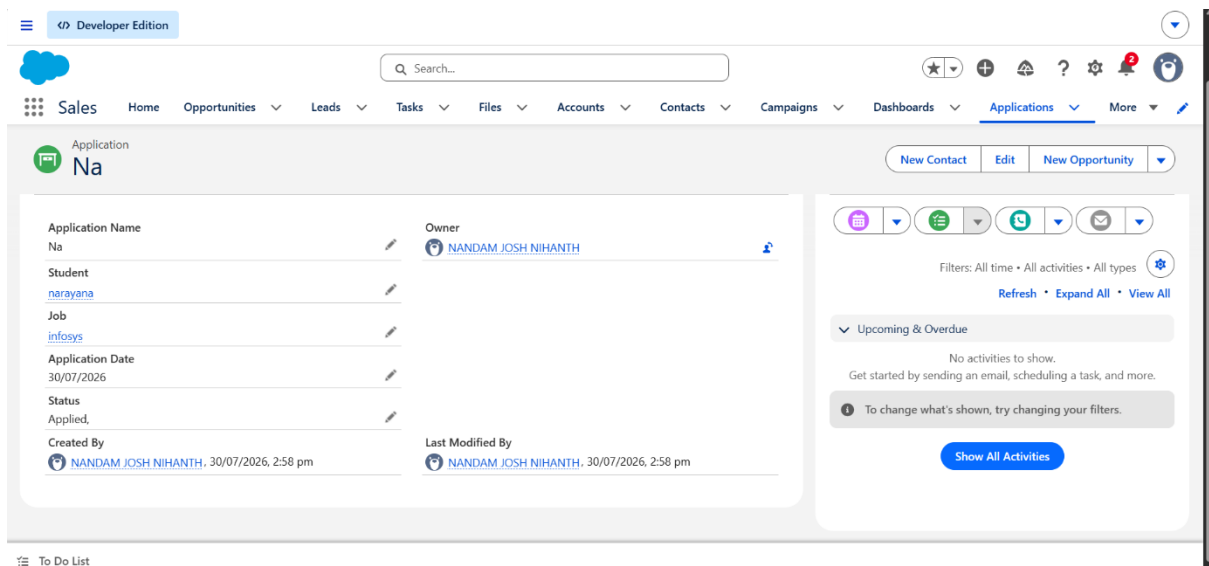

Then select the record triggered flow for the starting of the flow

After click + icon for adding the assignment element then

Label as the set application date for the api name it automatically filled into it.

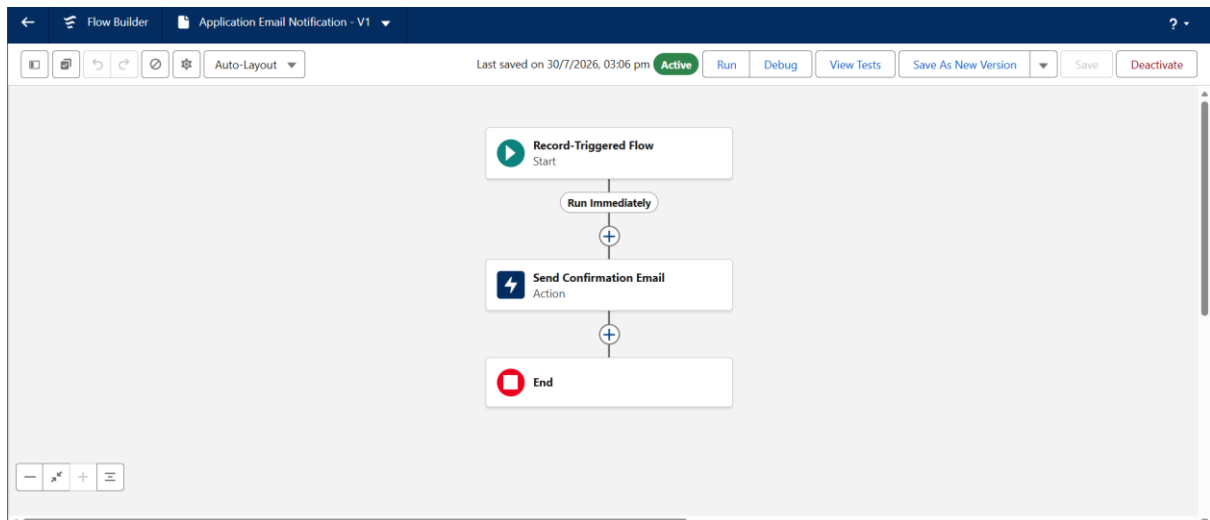

For the verification of the automatically application date setting we have to create the new application then filled we don't need to entire the date just by clicking the save it automatically .

For the email automation for same as I that I creating the element I used the action button then I choose the send email option in that it automatically send the email to the given email.

An After-Save Record-Triggered Flow was created on the Application object. Whenever a new Application is created, an email notification is automatically sent to the Placement Officer.

PART-5

Validation Rule Challenge

Validation Rule 1 – Reject Low CGPA

Formula : $\text{Student_r.CGPA_c} < \text{Job_r.Minimum_CGPA_c}$

 **Object Manager**

Application Validation Rule

[Back to Application](#)[Help for this Page](#)

Validation Rule Detail [Edit](#) [Clone](#)

Rule Name	Reject_Low_CGPA	Active	✓
Error Condition Formula	Student__r.CGPA__c < Job__r.Minimum_CGPA__c	Error Location	Top of Page
Error Message	Student CGPA is below the minimum CGPA required		
Description

Validation Rule 2 – Application Date Check

Formula : $\text{Application_Date_c} > \text{Job_r.Closing_Date_c}$

The screenshot shows a 'New Application' form with the following fields and values:

- Application Name:** kous
- Student:** koushik
- Job:** wipro
- Application Date:** 30/07/2026
- Status:** --None--
- Owner:** NANDAM JOSH NIHANTH

A validation error message is displayed: "We hit a snag. Review the errors on this page." The errors listed are:

- Application date must be on or before the closing date
- Student CGPA is below the minimum CGPA required

The form has buttons for 'Cancel', 'Save & New', and 'Save'.

Validation Rule 3 – Mandatory Fields

Formula: $\text{OR}(\text{ISBLANK}(\text{Student_c}), \text{ISBLANK}(\text{Job_c}))$

The screenshot shows a 'New Application' form with the following fields and values:

- Application Name:** kou
- Student:** Search Students...
- Job:** Search Jobs...
- Application Date:** 30/07/2026
- Status:** Applied,
- Owner:** NANDAM JOSH NIHANTH

A validation error message is displayed: "We hit a snag. Review the errors on this page." The error listed is:

- Student and Job selection required

The form has buttons for 'Cancel', 'Save & New', and 'Save'.

PART-6

Trigger vs Flow Debate

1. Update a field automatically.

Flow - Fast and efficient field updates without Apex

2. Create a related record.

Flow- After-Save Flow creates related records easily.

3. Send an email notification.

Flow - Built-in email action.

4. Call an external REST API.

Apex Trigger- Apex supports HTTP callouts and integrations.

5. Perform complex calculations involving multiple objects.

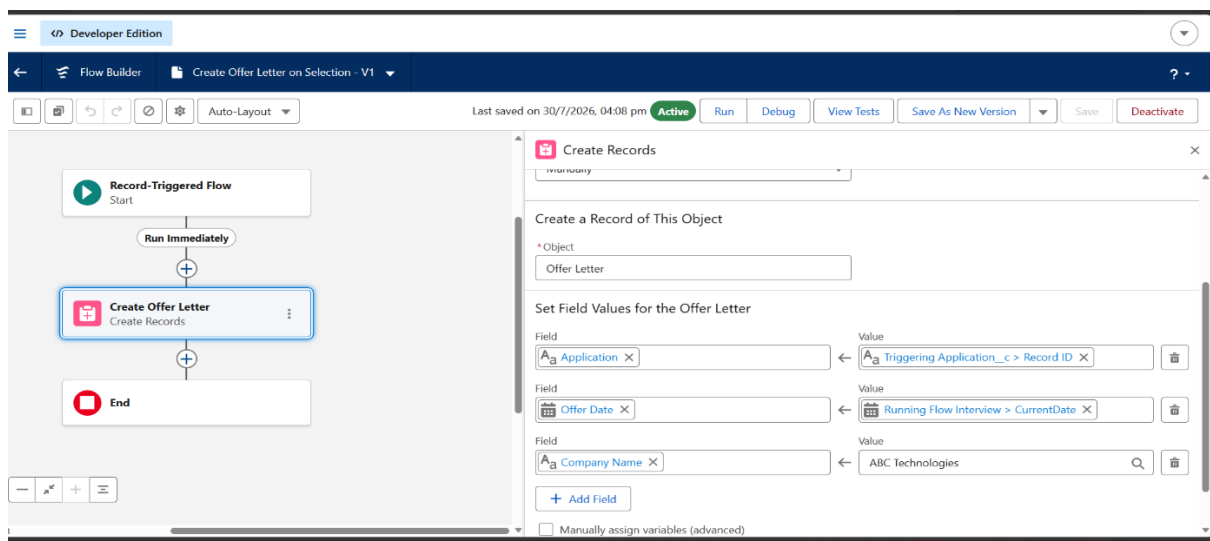

Apex Trigger - Better suited for advanced business logic.

6. Process 10,000 imported records.

Apex Trigger - Optimized for bulk processing and performance

PART-7

The objective of this enhancement is to improve the Placement Management System by implementing automation using Salesforce Flows and Validation Rules. These enhancements reduce manual effort

Created a Before-Save Record-Triggered Flow on the Application object to automatically populate the Application Date when a new application is created.

A screenshot of a Salesforce record creation form for the 'Application' object. The form is titled 'Application' and includes a legend indicating that fields with an asterisk (*) are required. The form contains the following fields and values:

- Application Name** (Required): nan
- Owner**: NANDAM JOSH NIHANTH
- Student**: pranee
- Job**: infosys
- Application Date**: 30/07/2026
- Status**: Applied
- Created By**: NANDAM JOSH NIHANTH, 30/07/2026, 3:09 pm
- Last Modified By**: NANDAM JOSH NIHANTH, 30/07/2026, 3:09 pm

At the bottom of the form, there are three buttons: 'Cancel', 'Save & New', and 'Save'.

Student CGPA meets the minimum job requirement.

Application Date is not after the Job Closing Date.

Mandatory fields are not left blank.

A screenshot of the Salesforce 'Offer Letter' record details page. The record ID is 'a0AdM00000CtAxV'. The page shows the following details:

- Offer Letter Name**: a0AdM00000CtAxV
- Application**: Na
- Offer Date**: 30/07/2026
- Company Name**: ABC Technologies
- Created By**: NANDAM JOSH NIHANTH, 30/07/2026, 4:09 pm
- Last Modified By**: NANDAM JOSH NIHANTH, 30/07/2026, 4:09 pm

The page also includes a navigation bar with tabs for 'Related' and 'Details', and an 'Activity' section on the right. The 'Activity' section shows a list of activities, with a filter set to 'All time • All activities • All types'. The 'Upcoming & Overdue' section indicates that there are no activities to show.

The Placement Management System was successfully enhanced using Salesforce declarative automation. All required automations were implemented without using Apex, following Salesforce best practices.

Part 8 – Debugging Challenge

Problem

If a Trigger, Flow, and Workflow all update the same Status field, they can conflict with each other and produce inconsistent results.

Could automation repeatedly execute?

Yes. The automation can enter a recursive loop where each automation updates the Status field again, causing repeated execution until Salesforce stops the process.

Redesigned Solution

- Use Record-Triggered Flow for field updates, email notifications, and related record creation.
 - Use Validation Rules for data validation.
 - Use Apex Triggers only for complex business logic or external integrations.
 - Ensure that only one automation tool updates the Status field.
-

PART-9

1. What is the difference between Workflow, Process Builder, and Flow?

Workflow Rules automate simple tasks such as field updates and email alerts. Process Builder supports more advanced automation with multiple criteria.

2. Why is Flow replacing Workflow Rules?

Flow provides more features, greater flexibility, and better performance than Workflow Rules and Process Builder. Salesforce recommends using Flow for all new automation.

3. What is a Record-Triggered Flow?

A Record-Triggered Flow is an automation that runs automatically whenever a record is created, updated, or deleted based on specified conditions.

4. What are Before-Save and After-Save Flows?

Before-Save Flow: Executes before the record is saved and is mainly used to update fields efficiently.

After-Save Flow: Executes after the record is saved and is used for actions such as sending emails, creating related records, and updating other records

5. When should Apex be preferred over Flow?

Apex should be used when the business logic is complex, requires external API integrations, performs advanced calculations, or handles scenarios that Flow cannot support.

6. Can Flow call Apex?

Yes. Flow can invoke Apex Actions when declarative automation alone cannot satisfy the business requirement.

7. What are the advantages of declarative automation?

Reduces coding effort.

Faster development.

Easy to maintain.

8. Explain one Flow that you built.

I created a Before-Save Record-Triggered Flow on the Application object that automatically populates the Application Date whenever a new application record is created.

9. Explain one Validation Rule that you created.

I created a Validation Rule to prevent students from applying for a job if their CGPA is lower than the minimum CGPA required for that job.

10. If given the choice, why did you use Flow instead of Apex?

I used Flow because the required business processes could be implemented without writing code.
